Examination results:

This is a general medical plus ortho and neuro to evaluate for cluster headaches with Horner's syndrome and bilateral shoulder condition. The veteran's occupation is that of a supervisor for a truck company.

HISTORY FOR THE COMPLAINTS

The veteran states that he has been having cluster headaches every since 1982 in the service. His dates of service is September 2, 1982 to August 30, 1993. The headaches are usually on the right side and accompanied with drooping of the right eyelid with a mild Horner's syndrome. This Horner's syndrome includes tearing of the right eye only during attacks plus stuffiness of the right nostril during attacks. The headaches are on the right side and accompany the ptosis of the right eyelid and Horner's syndrome. The cycles for these clusters come on approximately every 10 months and during these cycles the cycles will last for up to three to six months. During this period headaches will be frequent, three to 10 a day lasting from a short period of 10 to 15 minutes up to several hours. He has used several medications including oxygen therapy. Between the cycles when he is headache free, the veteran requires no medication. He has had multiple studies including skull x-rays, EEG and CAT scans which have been normal. His joint problems started in 1989 after doing situps and multiple exercises which showed the pain in both shoulders. He was treated

Psychiatric: Negative.

The veteran can handle his own affairs.

NEUROLOGIC EXAMINATION

For complete history see general medical examination. The veteran has a history of cluster headaches with mild Horner's syndrome on the right.

EXAMINATION

Reveals normal cranial nerves except for mild ptosis of the right upper eyelid. The other cranial nerves are within normal limits. Deep tendon reflexes are normal. Both upper and lower extremities: The strength is normal both upper and lower extremities. There is no sensory abnormalities noted. There are no abnormal reflexes. No specific studies are required at this time.

DIAGNOSIS

1. Cluster headaches with mild Horner's syndrome.

ORTHOPEDIC EXAMINATION

For the shoulders for history of pain in both shoulders see general medical examination.

EXAMINATION>

Of both shoulders revealed no tenderness to palpation of the right or left shoulder. Range of motion of right and left shoulder reveals shoulder elevation of 180 degrees, abduction of the right and left shoulder is 180 degrees. External and internal rotation of the right and left shoulder is 90 degrees bilateral.

X-rays of both shoulders have been ordered.
